                                                                                                                                        ਨੋ
                                                                                                                                                                                                                                                                                   The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence and come and acid sequence acid sequence as given in the specification (including their extracellular domains either or without their associated signal peptides. Also include are the nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a host cell comprising the vector, producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an antiporation professing and also for chromosome identification. PRO is also useful for tissue typing. PRO and PRO NA are useful as hybridisation probase for a CDNA library to isolate the full-length PRO CDNA. PRO NA is useful for generating transgenic animals or knock-cut animals which are useful in development and screening useful reagents. PRO NA is useful in development and screening useful reagents. PRO NA is useful in development for suppressing immune response. PRO1246 and pRO1410 polypeptides are useful for reating cardiac insufficiency disorders. PRO1266 polypeptide are useful for suppressing immune response. PRO1246 and PRO146 polypeptide are useful for treating calcium flux in human prolypeptides are useful for treating calcium flux in human collical wain endothelial cells. PRO1265, PRO1265 and PRO1418 polypeptides are useful for treating bone and/or cartiage disorders (e.g., arthritis) and wound healing. PRO130, PRO1265 and PRO1418 polypeptides are useful for treating bone and/or cartiage disorders (e.g., arthritis) and wound healing. PRO130, PRO1265, PRO1265, PRO1265, PRO1265, PRO1265, PRO1265, PRO1265, PRO1304, PRO1365, PRO1365, PRO1365, PRO1265, PRO1365, PRO1304, PRO1366, PRO1418 propermer PRO1418 are useful in treating that assembles are useful for treating that secure of the invention. The present sequence represents a PRO Protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

Submitted (OCT-2000) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: Suggested to be involved in kindling epileptogenesis and hippocampal plasticity.

-I- CATALYTIC ACTIVITY: Preferential cleavage: Arg-, Lys-.

-I- SUBCELULAR LOCATION: Secreted.

-I- ALTERNATIVE PRODUCTS:

-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-, Lys-.

-!- CATALYTIC ACTIVITY: Expressed specifically in the limbic symbolity.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Expressed specifically in the limbic symbols brain and is localized at highest concentration in proposampal CAl-3 subfields.

-!- MASS SPECTROMETRY: MW=26229; METHOD=MALDI; RANGE=29-260.

-!- MASS SPECTROMETRY: MW=26229; METHOD=MALDI; RANGE=33-260.

-!- SUMILARITY: Belongs to peptidase family S1. Kallikrein subsection and is localized at highest concentration in proposampal CAL-3 subfields.

Davies B.J., Pickard B.S., Steel M., Morris R.G.M., Lingerine proteases in rodent hippocampus.";
J. Biol. Chem. 273:23004-23011(1998).
-!- FUNCTION: Suggested to be involved in kindling ep:
hippocampal plasticity. Has a strong proteolytic and the protection (By similarity).
-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-, in CATALYTIC ACTIVITY: Restricted (By similarity).
-!- SUBCELLULAR LOCATION: Secreted (By similarity).
-!- TISSUE SPECIFICITY: Restricted to hippocampus.
-!- SIMILARITY: Belongs to peptidase family S1. Kalli

"Isolation and characterization of the chicken trypsinogen gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (BY SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     family.";
Biochem. J. 307:471-479(1995).

Biochem. J. 307:471-479(1995).

-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-Xaa, Lys
-!- COFACTOR: Binds 1 calcium ion per subunit (By similarity)
-!- COFACTOR: Binds 1 calcium ion per subunit (By similarity)
-!- SUBCELLULAR LOCATION: Extracellular.
-!- TISSUE SPECIFICITY: High levels are seen in the pancreas
lower levels are found in the liver, spleen and thymus.
-!- SIMILARITY: Belongs to peptidase family S1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CALCIUM (VIA CARBONYL OXYGEN)

Tissue-specific expression patterns and fine mapping of the huma kallikrein (KLK) locus on proximal 19q13.4.";
J. Biol. Chem. 275:37397-37406(2000).
-1- SUBCELLULAR LOCATION: Secreted (Probable).
-1- TISSUE SPECIFICITY: High expression in brain, bone marrow and fetal liver. Also expressed in liver, pancreas, fetal spleen, prostate and skeletal muscle.
-1- SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY).

LYPPAIN (EC 3.4.21.4) precursor - pig (tentative sequence)

Ny Contains: trypsingen
Cypecies: Sus scrofa domestica (domestic pig)
Cybate: 24.Apr.1984 #sequence revision 24.Apr.1984 #text_change 31-Mar-2000
Cybate: Sus scrofa domestica (domestic pig)
Cybate: Sus scrofa dowestica (domestic pig)
Cybate: Sus scrofa 69, 115-129, 1063

                serine proteinase SCCE precursor - human
N; Alternate names: stratum corneum chymotryptic enzyme
C; Species: Homo sapiens (man)
C; Date: 07-Jul-1995 #sequence_revision 07-Jul-1995 #text_change 2;
C; Accession: A53968
R; Hansson, L.; Stroemqvist, M.; Baeckman, A.; Wallbrandt, P.; Carl
J. Biol. Chem. 269, 19420-19426, 1994
A; Title: Cloning, expression, and characterization of stratum corn
A; Reference number: A53968; MUID:94308225; PMID:8034709
A; Accession: A53968
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-253 < HAN>
A; Cross-references: GB:L33404; NID:g521214; PIDN:AAC37551.1; PID:(C; Genetics:

trypsin (EC 3.4.21.4) precursor, cationic - rat
C;Species: Rattus norvegicus (Norway rat)
C;Date: 30-Jun-1988 #sequence_revision 30-Jun-1988 #text_change 22-Jun-1999
C;Accession: A27547
R;Fletcher, T.S.; Alhadeff, M.; Craik, C.S.; Largman, C.
Biochemistry 26, 3081-3086, 1987
A;Title: Isolation and characterization of a cDNA encoding rat cationic trypsi
A;Reference number: A27547; MUID:87271609; PMID:3607011
A;Reference number: A27547
A;Molecule type: mRNA
A;Residues: 1-247 <FLE>
A;Ccoss-references: GB:M16624; NID:g206498; PIDN:AAA41985.1; PID:g206499
C;Superfamily: trypsin; trypsin homology
C;Keywords: calcium binding; hydrolase; protein digestion; serine proteinase
F;25-240/Domain: trypsin homology <TRY>
F;31-161,49-65,133-234,140-207,172-186/Disulfide bonds: #status predicted
F;64,108,201/Active site: His, Asp, Ser #status predicted
F;76,78,81,86/Binding site: calcium (Glu, Asn, Val, Glu) #status predicted

(KLK-L) proteins for diagnosing and treating KLK-Lorders, especially cancer. disorders, New kallikrein-like protein mediated dis

Claim 12; Page 172; 184pp; English.

The present sequence is one of four alternatively spliced kallikrein-like proteins encoded by the human KLK-L4 gene. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used

The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24338 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention

The present invention describes an antibody that binds to a human protein

(I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO334;

(PRO1927; PRO3567; PRO1295; PRO1293; PRO1303; PRO444; PRO4354; PRO4397;

(PRO4407; PRO1555; PRO1096; PRO2262. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells.

(Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 contacting cell death. PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to protein sequences given in the exemplification of the present invention

 AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAX99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCF primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention

 The present invention provides the protein and coding sequence proteins from a variety of organisms, including human, dog, ca cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly urchin and tomato. These were derived from expressed sequence from the organism of interest. They can be used in diagnostics forensics, gene mapping, identification of mutations, to asses biodiversity and for nutritional purposes. The present sequence protein of the invention

Hillan KJ;
Watanabe
 The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nuclacids may also be used in gene therapy

The invention relates to human PRO polypeptides and the polynucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for protein electrophoresis and as therapeutic

 A
A
 The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity transmembrane protein) having at least 80% amino acid sequence as given in the specification (including their extracellular domains either or without their associated signal peptides. Also include are the nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a host cell comprising the vector, producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an antiper properties and also for chromosome identification. PRO is also useful for tissue typing. PRO and PRO NA are useful for tissue typing. PRO and PRO NA are useful for tissue typing. PRO and PRO NA are useful for tissue typing. PRO and RO NA are useful in development and screening useful reagents. PRO NA is also useful in development and screening useful reagents. PRO NA is also useful in development and screening useful reagents. PRO NA is also useful in gene therapy. PRO1244, PRO1256 and PRO1410 polypeptide are useful for repating cardiac insufficiency disorders. PRO1246 polypeptide are useful for treating cardiac insufficiency disorders. PRO126 polypeptide are useful for treating diabetes. PRO1374 polypeptides are useful for treating diabetes in skelteral mach control numbilical vent endertheilal cells. PRO1256, PRO1275 and PRO1418 polypeptides are useful for treating diabetes in skelteral mach cells and obesity. PRO1265, PRO1264 and PRO1382 polypeptides are useful for treating diabetes in skelteral mach properties are useful for treating diabetes in skelteral mach properties are useful for treating benefit some contern nephropathies ascentised with Schonlein-Hench purpurs, coellac disease, dermakeltis, herpetiformis or Crohn disease. PRO1478, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO1265, PRO1418, PRO126
